Notes

Agenda

1. Variable Selection Criteria
2. Automatic Search Procedures

Notes

Variable Selection

- What is the appropriate subset size?
- What is the best model for a fixed size?

Notes

Mallows' C_p Criterion

$$(\hat{Y}_i - \mu_i)^2 = (\hat{Y}_i - \mathrm{E}(\hat{Y}_i) + \mathrm{E}(\hat{Y}_i) - \mu_i)^2$$
$$= \underbrace{(\hat{Y}_i - \mathrm{E}(\hat{Y}_i))^2}_{\text{Variance}} + \underbrace{(\mathrm{E}(\hat{Y}_i) - \mu_i)^2}_{\text{Bias}^2},$$

where $\mu_i = \mathrm{E}(Y_i | X_i = x_i)$

- Mean squared prediction error (MSPE): $\sum_{i=1}^n \sigma^2_{\hat{Y}_i} + \sum_{i=1}^n (\mathrm{E}(\hat{Y}_i) - \mu_i)^2$
- C_p criterion measure:

$$\Gamma_p = \frac{\sum_{i=1}^n \sigma^2_{\hat{Y}_i} + \sum_{i=1}^n (\mathrm{E}(\hat{Y}_i) - \mu_i)^2}{\sigma^2}$$
$$= \frac{\sum \mathrm{Var}_{\text{pred}} + \sum \mathrm{Bias}^2}{\mathrm{Var}_{\text{error}}}$$

Notes

C_p Criterion

- Do not know σ^2 nor numerator
- Use $\mathrm{MSE}_{X_1,\cdots,X_{p-1}} = \mathrm{MSE}_F$ as the estimate for σ
- For numerator:
  - Can show $\sum_{i=1}^n \sigma^2_{\hat{Y}_i} = p\sigma^2$
  - Can also show $\sum_{i=1}^n (\mathrm{E}(\hat{Y}_i) - \mu_i)^2 = \mathrm{E}(\mathrm{SSE}_F) - (n-p)\sigma^2$

$\Rightarrow C_p = \frac{\mathrm{SSE} - (n-p)\mathrm{MSE}_F + p\mathrm{MSE}_F}{\mathrm{MSE}_F}$

Notes

C_p Criterion Cont'd

Recall

$$\Gamma_p = \frac{\sum_{i=1}^n \sigma^2_{\hat{Y}_i} + \sum_{i=1}^n (\mathrm{E}(\hat{Y}_i) - \mu_i)^2}{\sigma^2}$$

- When model is correct $\mathrm{E}(C_p) \approx p$
- When plotting models against p
  - Biased models will fall above $C_p = p$
  - Unbiased models will fall around line $C_p = p$
  - By definition: C_p for full model equals p

Notes

Adjusted R^2 Criterion

Adjusted R^2, denoted by R^2_{adj}, attempts to take account of the phenomenon of the R^2 automatically and spuriously increasing when extra explanatory variables are added to the model.

$$R^2_{\text{adj}} = 1 - \frac{\text{SSE}/(n-p-1)}{\text{SST}/(n-1)}$$

- Choose model which maximizes R^2_{adj}
- Same approach as choosing model with smallest MSE

Notes

Predicted Residual Sum of Squares $PRESS$ Criterion

- For each observation i, predict Y_i using model generated from other $n-1$ observations
- $PRESS = \sum_{i=1}^{n}(Y_i - \hat{Y}_{i(i)})^2$
- Want to select model with small $PRESS$

Notes

Other Approaches

- Akaikeâs information criterion (AIC)

$$n\log(\frac{\text{SSE}_k}{n}) + 2k$$

- Bayesian information criterion (BIC)

$$n\log(\frac{\text{SSE}_k}{n}) + k\log(n)$$

- Can be used to compare **non-nested** models

Notes

Automatic Search Procedures

- Forward Selection
- Backward Elimination
- Stepwise Search
- All Subset Selection
