Notes

Agenda

- 1 Bernoulli and Binomial Random Variables
- 2 Hypergeometric Random Variable
- 3 Continuous Random Variables

Notes

Example

Let X be a random variable with pmf defined as follows:

$$p_X(x) = \begin{cases} k(5-x) & \text{if } x = 0, 1, 2, 3, 4 \\ 0 & \text{otherwise} \end{cases}$$

- 1 Find the value of k that makes $p_X(x)$ a legitimate pmf.
- 2 What is the probability that X is between 1 and 3 inclusive?
- 3 If X is not 0, what is the probability that X is less than 3?

Notes

Example Cont'd

- Want to find k s.t.

$$\sum_{x=0}^4 p_X(x) = \sum_{x=0}^4 k(5-x) = 1$$

$$\Rightarrow 15k = 1 \Rightarrow k = \frac{1}{15}$$

$$P(1 \leq X \leq 3) = P(X=1) + P(X=2) + P(X=3)$$

$$= \frac{4}{15} + \frac{3}{15} + \frac{2}{15} = \frac{9}{15} = 0.6$$

$$P(X < 3 | X \neq 0) = \frac{P(X < 3 \& X \neq 0)}{P(X \neq 0)}$$

$$= \frac{P(0 < X < 3)}{1 - P(X=0)} = \frac{4/15 + 3/15}{1 - 5/15} = 0.7$$

Notes

Mean of Discrete Random Variables

The mean of a discrete r.v. X , denoted by $E[X]$, is defined by

$$E[X] = \sum_x x \times p_X(x)$$

Remark:

The mean of a discrete r.v. is a weighted average of its possible values, and the weight used is its probability. Sometimes we refer to the expected value as the **expectation (expected value)**, or the **first moment**.

For any function, say $g(X)$, we can also find an expectation of that function. It is

$$E[g(X)] = \sum_x g(x) \times p_X(x)$$

Example

$$E[X^2] = \sum_x x^2 \times p_X(x)$$

Notes

Properties of Mean

Let X and Y be discrete r.v.s defined on the same sample space and having finite expectation (i.e. $E[X], E[Y] < \infty$). Let a and b be constants. Then the following hold:

- $E[X + Y] = E[X] + E[Y]$
- $E[aX + b] = a \times E[X] + b$

Notes

Number of Siblings Example Revisited

Siblings (X)	Frequency	Relative Frequency
0	8	.200
1	17	.425
2	11	.275
3	3	.075
4	1	.025
Total	40	1

Find the expected value of the number of siblings

Solution.

$$\mathbb{E}[X] = \sum_x xp_X(x) = 0 \times .200 + 1 \times .425 + 2 \times .275 + 3 \times .075 + 4 \times .025 = 1.3$$

Variance/Standard Deviation of Discrete r.v.'s

The **variance** of a (discrete) r.v., denoted by $\text{Var}(X)$, is a measure of the spread, or variability, in the r.v. $\text{Var}(X)$ is defined by

$$\text{Var}(X) = \mathbb{E}[(X - \mathbb{E}[x])^2]$$

or

$$\text{Var}(X) = \mathbb{E}[X^2] - (\mathbb{E}[X])^2$$

The **standard deviation**, denoted by $sd(X)$, is the square root of its variance

Continuous Random Variables

8.8

Notes

Properties of Variance

Let c be a constant. Then the following hold:

- $\text{Var}(cX) = c^2 \times \text{Var}(X)$
- $\text{Var}(X + c) = \text{Var}(X)$

Notes

Example

Suppose X and Y are random variables with $E[X] = 3$, $E[Y] = 4$ and $\text{Var}(X) = 4$. Find:

- 1 $E[2X + 1]$
- 2 $E[X - Y]$
- 3 $E[X^2]$
- 4 $E[X^2 - 4]$
- 5 $E[(X - 4)^2]$
- 6 $\text{Var}(2X - 4)$

Notes

Bernoulli Trials

Many problems in probability and its applications involve **independently** repeating a random experiment and observing at each repetition whether a specified event occurs. We label the occurrence of the specified event a **success** and the nonoccurrence of the specified event a **failure**.

Example:
Tossing a coin several times

Notes

Bernoulli Trials Cont'd

Bernoulli trials:

- Each repetition of the random experiment is called a trial
- We use p to denote the probability of a success on a single trial

Properties of Bernoulli trials:

- Exactly two possible outcomes **success** and **failure**
- The outcomes of trials are **independent** of one another
- The success probability, p , and therefore the failure probability, $(1 - p)$, remains the same from trial to trial

Notes

Binomial Random Variable

We define the **Binomial** r.v. as the number of successes in n Bernoulli trials, where the probability of success in one trial is p . Let X be a Binomial r.v.

- The definition of X : **# of successes in n trials of Bernoulli trials.**
- The support: $0, 1, \dots, n$
- Its parameter(s) and definition(s): **p : the probability of success on 1 trial; n is the sample size**
- The probability mass function (pmf):

$$p_X(x) = \binom{n}{x} p^x (1-p)^{n-x}, \quad x = 0, 1, \dots, n$$

- The expected value:

$$E[X] = np$$

- The variance:

$$\text{Var}(X) = np(1-p)$$

Notes

Example

To test for Extrasensory perception (ESP), we have 4 cards. They will be shuffled and one randomly selected each time, and you are to guess which card is selected. This is repeated 10 times. Suppose you do not have ESP. Let R be the number of times you guess a card correctly. What are the distribution and parameter(s) of R ? What is the expected value of R ? Furthermore, suppose that you get certified as having ESP if you score at least an 8 on the test. What is the probability that you get certified as having ESP?

Solution.

$$R \sim \text{Binomial}(n = 10, p = \frac{1}{4} = .25)$$

$$E[R] = n \times p = 2.5$$

$$P(X \geq 8) = .000416$$

Notes

Example

Suppose that 95% of consumers can recognize Coke in a blind taste test. Assume consumers are independent of one another. The company randomly selects 4 consumers for a taste test. Let X be the number of consumers who recognize Coke.

- What is the probability that X is at least 1?

- What is the probability that X is at most 3?

Notes

Binomial and Hypergeometric r.v.s

The binomial distribution describes the probability of k successes in n trials **with replacement**.

We want a distribution to describe the probability of k successes in n trials **without replacement** from a finite population of size N containing exactly K successes.

⇒ **Hypergeometric Distribution**

Important applications are **quality control** and statistical **estimation of population proportions**. The hypergeometric r.v. is the equivalent of a Binomial r.v. except that sampling is done **without replacement**.

Notes

An Example of Hypergeometric r.v.

Notes

Hypergeometric r.v.s

Let X be a hypergeometric r.v.

- The definition of X : **# of successes in n trials of a random experiment, where sampling is done without replacement (or trials are dependent)**
- The support: $k \in \{\max(0, n + K - N), \dots, \min(n, K)\}$
- Its parameter(s) and definition(s): N : **the population size**, n : **the sample size**, and K : **number of success in the population**
- The probability mass function (pmf):
$$p_X(k) = \frac{\binom{K}{k} \times \binom{N-K}{n-k}}{\binom{N}{n}}$$
- The expected value: $E[X] = n \frac{K}{N}$
- The variance: $\text{Var}(X) = n \frac{K}{N} \frac{N-K}{N} \frac{N-n}{N-1}$

Notes

Example

There are 100 identical looking 52" TVs at Best Buy in Anderson, SC. Let 10 of them be defective. Suppose we want to buy 8 of the aforementioned TVs (at random). What is the probability that we don't get any defective TVs?

Solution.

Let D be the number of defective TVs in the sample.

$$D \sim \text{Hyp}(N = 100, n = 8, K = 10)$$

$$P(D = 0) = \frac{\binom{10}{0} \binom{90}{8}}{\binom{100}{8}} = 0.4166$$

Probability Mass Functions vs. Probability Density Functions

Remarks:

- pmf assigns probabilities to each possible values of a discrete random variable
- pdf describes the relative likelihood for a continuous random variable to take on a given interval

Notes

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \leq p_X(x) \leq 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \leq X \leq b) = \sum_{x=a}^{x=b} p_X(x)$

For continuous distributions, the properties for probability density functions (Pdf's) are similar:

- $f_X(x) \geq 0$ for all possible values of x
- $\int_{-\infty}^{\infty} f_X(x) dx = 1$
- $\mathbb{P}(a \leq X \leq b) = \int_a^b f_X(x) dx$

Notes

Cumulative Distribution Functions (cdfs) for Continuous r.v.s

- The cdf $F_X(x)$ is defined as

$$F_X(x) = \mathbb{P}(X \leq x) = \int_{-\infty}^x f_X(x) dx$$
- we use cdf to calculate probabilities of a continuous random variable within an interval, i.e.

$$\mathbb{P}(a \leq X \leq b) = \int_a^b f_X(x) dx = \int_{-\infty}^b f_X(x) dx - \int_{-\infty}^a f_X(x) dx = \boxed{F_X(b) - F_X(a)}$$

Remark: $\mathbb{P}(X = x) = \int_x^x f_X(x) dx = 0$ for all possible values of x

Notes

Expected Value and Variance

Recall the expected value formula for the discrete random variable: $\mathbb{E}[X] = \sum_x x p_X(x)$

For continuous random variables, we have similar formulas:

Let a , b , and c are constant real numbers

- $\mathbb{E}[X] = \int_{-\infty}^{\infty} x f_X(x) dx$
- $\mathbb{E}[g(X)] = \int_{-\infty}^{\infty} g(x) f_X(x) dx$
- $\mathbb{E}[X + Y] = \mathbb{E}[X] + \mathbb{E}[Y]$
- $\mathbb{E}[cX] = c\mathbb{E}[X]$
- $\mathbb{E}[aX + bY] = a\mathbb{E}[X] + b\mathbb{E}[Y]$
- $\text{Var}(X) = \mathbb{E}[X^2] - (\mathbb{E}[X])^2 = \int_{-\infty}^{\infty} x^2 f_X(x) dx - \left(\int_{-\infty}^{\infty} x f_X(x) dx \right)^2$
- $\text{Var}(cX) = c^2 \text{Var}(X)$
- $\text{Var}(X - c) = \text{Var}(X)$

Notes

Example

Let X represent the diameter in inches of a circular disk cut by a machine. Let $f_X(x) = c(4x - x^2)$ for $1 \leq x \leq 4$ and be 0 otherwise. Answer the following questions:

- 1 Find the value of c that makes this a valid pdf
- 2 Find the expected value and variance of X
- 3 What is the probability that X is within .5 inches of the expected diameter?
- 4 Find $F_X(x)$
