### Statistical Inference

For the rest of the semester, we will focus on conducting **statistical inferences** for the following tasks:

- Estimating one population mean
- Comparing two population means
- Comparing more than two population means
- Estimating population proportions
- Estimating relationship between response variable and predictors

Notes

---

---

---

---

---

### Statistical Science: Use Sample to Learn About the Population

- We use **parameters** to describe the population  
**Example:** mean ( $\mu_X$ ); variacen ( $\sigma_X^2$ )

- We use **statistics** of a sample (given that the sampling was done properly) to infer the population  
**Example:** sample mean ( $\bar{X}$ ); sample variance ( $s_X^2$ )

Estimating One Population Mean

- Goal:** To estimate the population mean using a (representative) sample:
- The sample mean,  $\bar{X}_n = \frac{\sum_{i=1}^n X_i}{n}$ , is a reasonable **point estimate** of the population mean  $\mu_X$
  - Need to quantify the level of uncertainty of the point estimate  $\Rightarrow$  **Interval estimation**
  - Need to figure out the **sampling distribution** of  $\bar{X}_n$  in order to construct interval estimates  $\Rightarrow$  Central Limit Theorem (CLT)

Central Limit Theorem (CLT)

**CLT**

The **sampling distribution** of  $\bar{X}_n$  will become approximately **normally distributed** as the **sample size** ( $n$ ) becomes “large”, **regardless of the shape of the population distribution!**

Let  $X_1, X_2, \dots, X_n$  be a random sample from a population  $X$  with  $\mu = \mathbb{E}[X]$  and  $\sigma^2 = \text{Var}[X]$ . Then  $\bar{X}_n = \frac{\sum_{i=1}^n X_i}{n} \xrightarrow{d} N(\mu, \frac{\sigma^2}{n})$  as  $n \rightarrow \infty$ .

---

---

CLT In Action

- 1 Generate 100 ( $n$ ) random numbers from an Exponential distribution (population distribution)
- 2 Compute the **sample mean** of these 100 random numbers
- 3 Repeat this process 120 times

## CLT: Sample Size ( $n$ ) and the Normal Approximation

### Notes

---

---

---

---

---

---

---

---

## Why CLT is important?

- CLT tells us the **distribution** of our estimator

$$\bar{X}_n \approx N\left(\mu, \frac{\sigma^2}{n}\right)$$

- The distribution of  $\bar{X}_n$  is center around the true mean  $\mu$
- The variance of  $\bar{X}_n$  is decrease with  $n$
- With normality approximation of the sampling distribution of  $\bar{X}_n$ , we can perform interval estimation about  $\mu$
- Applications: [Confidence Interval](#), [Hypothesis testing](#)

## Confidence Intervals (CIs) for $\mu$

- Let's assume we know the population  $\sigma^2$  (will relax this assumption later on)
- $(1 - \alpha) \times 100\%$  CI for  $\mu$ :

$$\left[ \bar{X}_n - z_{(1-\frac{\alpha}{2})} \frac{\sigma}{\sqrt{n}}, \bar{X}_n + z_{(1-\frac{\alpha}{2})} \frac{\sigma}{\sqrt{n}} \right],$$

where  $z_{(1-\frac{\alpha}{2})}$  is the  $1 - \frac{\alpha}{2}$  percentile of  $Z \sim N(0, 1)$

- $\frac{\sigma}{\sqrt{n}}$  is the **standard error** of  $\bar{X}_n$ , that is, the standard deviation of its sampling distribution

Making Sense of Confidence Intervals

For any  $\alpha \in (0, 1)$ :

$$\begin{aligned} &\mathbb{P}\left(\bar{X}_n - z_{(1-\frac{\alpha}{2})}\frac{\sigma}{\sqrt{n}} \leq \mu \leq \bar{X}_n + z_{(1-\frac{\alpha}{2})}\frac{\sigma}{\sqrt{n}}\right) \\ &= \mathbb{P}\left(-z_{(1-\frac{\alpha}{2})}\frac{\sigma}{\sqrt{n}} \leq \bar{X}_n - \mu \leq z_{(1-\frac{\alpha}{2})}\frac{\sigma}{\sqrt{n}}\right) \\ &= \mathbb{P}\left(-z_{(1-\frac{\alpha}{2})} \leq \frac{\bar{X}_n - \mu}{\frac{\sigma}{\sqrt{n}}} \leq z_{(1-\frac{\alpha}{2})}\right) \\ &= \mathbb{P}\left(-z_{(1-\frac{\alpha}{2})} \leq Z \leq z_{(1-\frac{\alpha}{2})}\right) \\ &= 1 - \frac{\alpha}{2} - \frac{\alpha}{2} = 1 - \alpha \end{aligned}$$
