- Summarizing the data
- Analyzing the data
- Reporting and interpreting the results

Collecting Data: Statistical Sampling

Statistical sampling is the procedure to select a subset from a statistical **population** that is representative of the population. There are several types of sampling:

- **Simple random sampling (SRS)**: a sample selected such that each element in the population has the same probability of being selected

Simple random sample

Collecting Data: Statistical Sampling

Statistical sampling is the procedure to select a subset from a statistical **population** that is representative of the population. There are several types of sampling:

- **Simple random sampling (SRS)**: a sample selected such that each element in the population has the same probability of being selected

Simple random sample

- **Stratified sample**: elements in the population are first divided into groups and a simple random sample is then taken from each group

Stratified sample

Sampling cont'd

- **Cluster sampling**: the elements in the population are first divided into separate groups called clusters and then a simple random sample of the clusters is taken that all elements in a selected cluster are part of a sample

Cluster sample

Sampling cont'd

- **Cluster sampling**: the elements in the population are first divided into separate groups called clusters and then a simple random sample of the clusters is taken that all elements in a selected cluster are part of a sample

Cluster sample

- **Systematic sampling**: randomly select one of the first k elements from the population and then every k_{th} element thereafter is picked

Systematic sample

Sampling cont'd

- **Cluster sampling**: the elements in the population are first divided into separate groups called clusters and then a simple random sample of the clusters is taken that all elements in a selected cluster are part of a sample

Cluster sample

- **Systematic sampling**: randomly select one of the first k elements from the population and then every k_{th} element thereafter is picked

Systematic sample

- **Convenience sampling**: elements selected from the population on the basis of convenience

What type of sampling was used?

- 1 A researcher randomly chooses houses in a town. Once a particular house is chosen everyone living in the house is surveyed
- 2 A school principal decides to perform an exit interview with every 14th name from a list of graduating seniors
- 3 A biologist knows that 40% of bats are male and that 60% are female so she randomly selects 20 males and randomly selects 30 females to be in her sample
- 4 A graduate student wants to do a study on why people like bluegrass music and uses the people she meets at the next show she attends as her sample
- 5 To get an idea of the average weight of his cattle, a rancher randomly chooses to weigh 25 from his list of the animals

Summarizing Categorical Variables

Example: Sport Injuries

The paper *“Profile of sport/leisure injuries treated at emergency rooms of urban hospitals.”* by Pelletier et al. 1991 examined the nature and number of sport/leisure injuries treated in hospital emergency rooms in a large metropolitan city. They classified non-contact sports injuries by sport, resulting in the following data set:

Sport
Soccer
Basketball
Others
Basketball
Touch Football
Others
Touch Football
Volleyball
Baseball/softball
⋮

Question: How to summarize this data set?

- A **frequency table** for **categorical data** is a table that displays the possible categories along with the associated **frequencies** or **relative frequencies**
- The **frequency** for a particular category is the number of times the category appears in the data set
- The **relative frequency** for a particular category is the fraction or proportion of the time that the category appears in the data set. It is calculated as:

relative frequency =

Frequencies and Relative Frequencies

```
> table(sport)
sport
Baseball/softball      Basketball      Bicycling      Jogging/running
           11           19           11           11
      Others      Soccer      Touch Football      Volleyball
           47           24           38           17

> table(sport) / dim(sport)[1]
sport
Baseball/softball      Basketball      Bicycling      Jogging/running
    0.06179775    0.10674157    0.06179775    0.06179775
      Others      Soccer      Touch Football      Volleyball
    0.26404494    0.13483146    0.21348315    0.09550562
```

Frequencies and Relative Frequencies

```
> table(sport)
sport
Baseball/softball      Basketball      Bicycling      Jogging/running
           11              19              11              11
      Others      Soccer      Touch Football      Volleyball
           47              24              38              17

> table(sport) / dim(sport)[1]
sport
Baseball/softball      Basketball      Bicycling      Jogging/running
    0.06179775    0.10674157    0.06179775    0.06179775
      Others      Soccer      Touch Football      Volleyball
    0.26404494    0.13483146    0.21348315    0.09550562
```

How could we visualize these information?

⇒ Making a **bar chart** and/or a **pie chart**

Bar Charts

A **bar chart** draws a bar with a height proportional to the count in the table:

Bar Charts cont'd

Pie Charts

Pie Charts cont'd

Discussion: Which one you prefer to visualize categorical variables. Why?

A Good Bar Chart

A (Potential) Misleading Bar Chart

Same Data, Different Y-Axis

Example: O'Hare Airport Flight Data

	carrier	origin
1	UA	EWR
2	AA	LGA
3	AA	LGA
4	AA	LGA
5	UA	LGA
6	UA	EWR

In this example, we have two categorical variables, `carrier` and `origin`, respectively. How to summarize/visualize this dataset?

ORD Flight Data Cont'd

	EWR	LGA
AA	0	5694
UA	3822	3162

	EWR	LGA
AA	0.00	0.45
UA	0.30	0.25

Summarizing Numerical Variables

Example: Murder arrests (per 100,000) in US States in 1973

Data: 13.2, 10.0, 8.1, 8.8, 9.0, 7.9, 3.3, 5.9,
15.4, 17.4, 5.3, 2.6, 10.4, 7.2, 2.2, 6.0,
9.7, 15.4, 2.1, 11.3, 4.4, 12.1, 2.7, 16.1,
9.0, 6.0, 4.3, 12.2, 2.1, 7.4, 11.4, 11.1,
13.0, 0.8, 7.3, 6.6, 4.9, 6.3, 3.4, 14.4, 3.8,
13.2, 12.7, 3.2, 2.2, 8.5, 4.0, 5.7, 2.6, 6.8.

Question: How to graphically summarize this data set?

Stem-and-Leaf Plot

The decimal point is at the |

```
0 | 8
1 |
2 | 1122667
3 | 2348
4 | 0349
5 | 379
6 | 00368
7 | 2349
8 | 158
9 | 007
10 | 04
11 | 134
12 | 127
13 | 022
14 | 4
15 | 44
16 | 1
17 | 4
```

Murder Rate (per 100,000)

Shape of Distributions

Source: [Skewness - Wikipedia](#)

In the rest of the class, we will talk about how to summarize a numerical variable in terms of its **center** and **spread**

- A **measure of center** attempts to report a “typical” value for the variable
- When a measure of center is calculated with **sample data** it is a **statistic**
- When a measure of center is calculated with popular (e.g., census data) it is a **parameter**
- **Measures:** Mean, Median, Mode

- The **population mean**, denoted by μ_X , is the sum of all the population values ($\{X_i, \dots, X_N\}$) divided by the size of the population (N). That is,

$$\mu_X = \frac{\sum_{i=1}^N X_i}{N}$$

- The **sample mean**, denoted by \bar{X} is the sum of all the sample values ($\{X_1, \dots, X_n\}$) divided by the sample size (n). That is,

$$\bar{X} = \frac{\sum_{i=1}^n X_i}{n}$$

The **median** is the value separating the higher half from the lower half of a data sample

How to compute the median: Order the n observations in a data set from smallest to largest, then

$$\text{Median} = \begin{cases} \text{the single middle value,} & n \text{ odd} \\ \text{the average of the middle two values,} & n \text{ even} \end{cases}$$

The **mode** is the value of the observation that appears most frequently

How to compute the mode(s): Order the observations in a data set from smallest to largest, then find the number that is repeated more often than any other

Example

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Plot this “data set” and describe the shape of the distribution

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 21 + 13}{9} = 15$$

- Find the sample median

1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 21 + 13}{9} = 15$$

- Find the sample median

1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 21 + 13}{9} = 15$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21
- 2 Compute the sample size n and identify (or compute) the median value

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 21 + 13}{9} = 15$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21
- 2 Compute the sample size n and identify (or compute) the median value

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 21 + 13}{9} = 15$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21
- 2 Compute the sample size n and identify (or compute) the median value
- 3 $n = 9 \Rightarrow$ the median is the 5th number, which is 14

- Find the mode
 - ① Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21

- Find the mode
 - ① Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21

- Find the mode
 - 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 21
 - 2 We have 3 13 and 2 14 \Rightarrow 13 is the mode

Example: Resistant (Robust) Statistics

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 210 + 13}{9} = 36$$

- Find the sample median

1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

Example: Resistant (Robust) Statistics

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 210 + 13}{9} = 36$$

- Find the sample median

1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

Example: Resistant (Robust) Statistics

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 210 + 13}{9} = 36$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210
- 2 Compute the sample size n and identify (or compute) the median value

Example: Resistant (Robust) Statistics

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 210 + 13}{9} = 36$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210
- 2 Compute the sample size n and identify (or compute) the median value

Example: Resistant (Robust) Statistics

Suppose we have the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

- Find the sample mean

$$\bar{X} = \sum_{i=1}^9 \frac{13 + 18 + 13 + 14 + 13 + 16 + 14 + 210 + 13}{9} = 36$$

- Find the sample median

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210
- 2 Compute the sample size n and identify (or compute) the median value
- 3 $n = 9 \Rightarrow$ the median is the 5th number, which is (still) 14

- Find the mode
 - ① Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

- Find the mode
 - ① Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

- Find the mode

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

- 2 We have 3 13 and 2 14 \Rightarrow 13 is (still) the mode

- Find the mode

- 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210

- 2 We have 3 13 and 2 14 \Rightarrow 13 is (still) the mode

- Find the mode
 - 1 Order the data first: 13, 13, 13, 13, 14, 14, 16, 18, 210
 - 2 We have 3 13 and 2 14 \Rightarrow 13 is (still) the mode

What is the take-home message?

Measures of Spread

- **Measures:** Range, Variance/Standard Deviation, Interquartile range (IQR)

The **range** of a dataset is the difference between the largest and smallest values

$$\text{Range} = \text{Largest Value} - \text{Smallest Value}$$

- Compute the range of the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13
- Compute the range of the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

Question: Is Range a robust statistic?

- The sample standard deviation (variance), denoted by s (s^2), is a measure of the amount of variation of data. s (s^2) can be used as the estimate of the population standard deviation (variance), denoted by σ (σ^2)
- s is calculated in the following way:
 - 1 Calculate the sample mean \bar{X}
 - 2 Calculate the deviation (from the sample mean) for each observation (i.e., $X_i - \bar{X}$, $i = 1, \dots, n$)
 - 3 Square each deviation and add them (i.e., $\sum_{i=1}^n (X_i - \bar{X})^2$)
 - 4 Divide by $n - 1$ and take the square root, that is,

$$s = \sqrt{\frac{\sum_{i=1}^n (X_i - \bar{X})^2}{n - 1}}$$

Example

- Compute s of the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13
- Compute s of the following list of values: 13, 18, 13, 14, 13, 16, 14, 210, 13

Question: Is standard deviation a robust statistic?

Interquartile range (IQR)

- $IQR = Q_3 - Q_1$, where Q_1 is the **Lower Quartile** (the median of the lower half of the data) and Q_3 is the **Upper Quartile** (the median of the upper half of the data)
- Compute the IQR of the following list of values: 13, 18, 13, 14, 13, 16, 14, 21, 13
- Compute the IQR of the following list of values: 13, 18, 13, 14, 13, 16, 14, **210**, 13

Question: Is IQR a robust statistic?

Summary

In this lecture, we learned

- Sampling Techniques
- Summarizing Categorical Data
- Summarizing Numerical Data

In next lecture we will learn

- How to construct a boxplot
- How to visualize numerical + categorical variables and numerical + numerical variables
- How to visualize time series, cross-sectional, and spatio-temporal Data sets
