Regression with Both Quantitative and Qualitative Predictors

Salaries for Professors Data Set

The 2008-09 nine-month academic salary for Assistant Professors, Associate Professors and Professors in a college in the U.S. The data were collected as part of the on-going effort of the college's administration to monitor salary differences between male and female faculty members.

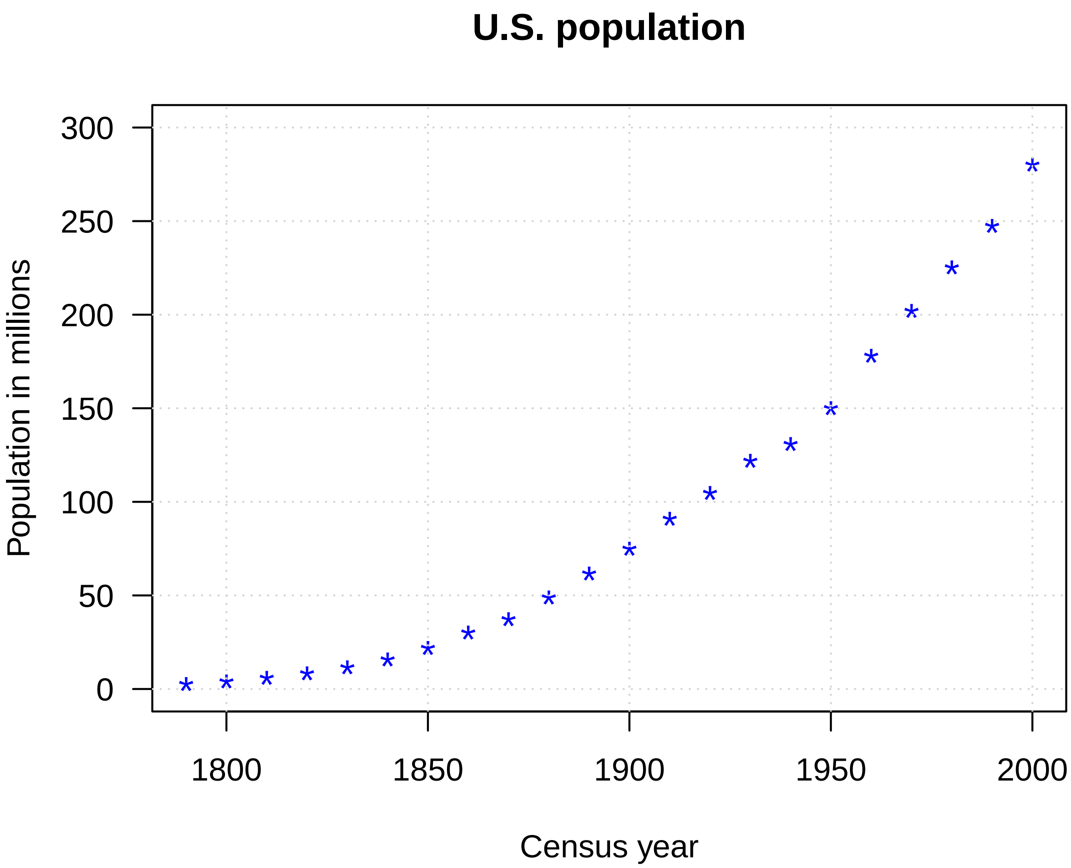
Nonlinear Regression

U.S. Population Example

```
library(car)
plot(population ~ year, data = USPop, main = "U.S. population",
     ylim = c(0, 300),pch = "*", xlab = "Census year",
     ylab = "Population in millions", cex = 1.25, las = 1, col = "blue")
grid()
```



Logistic growth curve

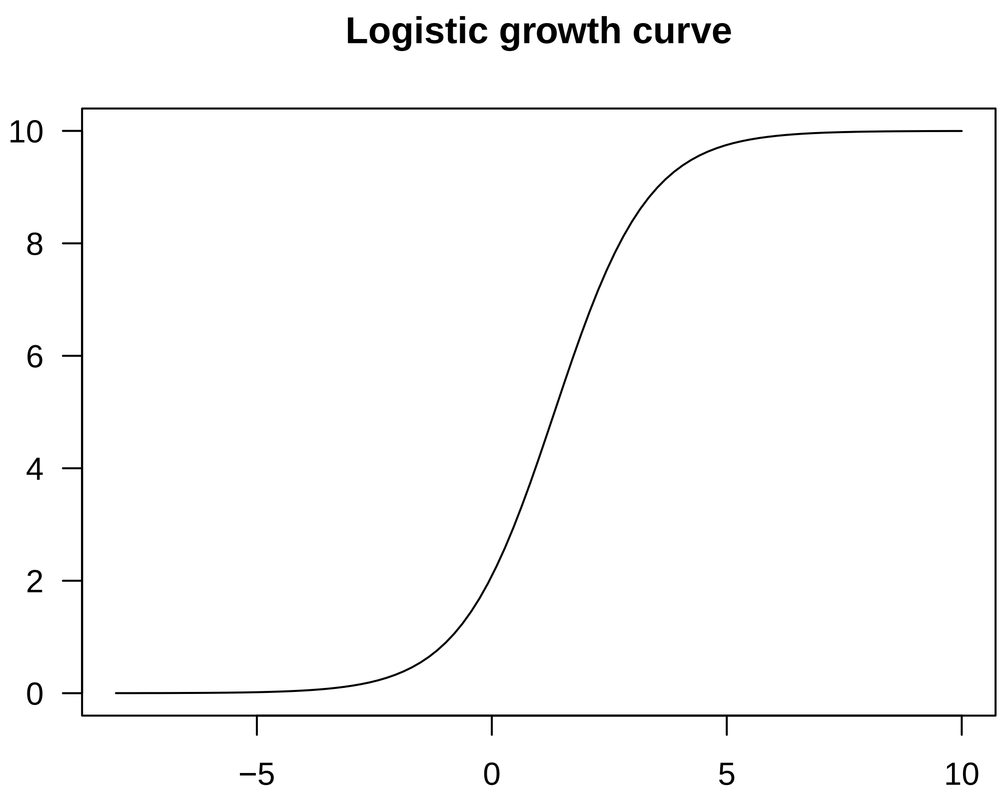
A logistic function is a symmetric S shape curve with equation:

$$f(x) = \frac{\phi_1}{1 + \exp(-(x - \phi_2)/\phi_3)}$$

where ϕ_1 is the curve's maximum value; ϕ_2 is the curve's midpoint in x; and ϕ_3 is the "range" (or the inverse growth rate) of the curve.

One typical application of the logistic equation is to model population growth.

```
# phi_1 = 10; phi_2 = 4/3, phi_3 = 1
curve(10 / (1 + exp(-(x - 4/3))), from = -8, to = 10, main = "Logistic growth curve",
      las = 1, xlab = "", ylab = "")
```



Fit a logistic growth curve to the U.S. population data set

```
pop.ss <- nls(population ~ SSlogis(year, phi1, phi2, phi3), data = USPop)
summary(pop.ss)
```

```
##
## Formula: population ~ SSlogis(year, phi1, phi2, phi3)
##
## Parameters:
##      Estimate Std. Error t value Pr(>|t|)
## phi1  440.833     35.000   12.60 1.14e-10 ***
## phi2 1976.634      7.556  261.61  < 2e-16 ***
## phi3   46.284      2.157   21.45 8.87e-15 ***
