#### Agenda

Descriptive Statistics

Graphs and Visualization

Descriptive Statistics

#### **Organization of Data and Notation**

- We will use n to denote the number of individuals or units in our sample and use p to denote the number of variables measured on each unit.
- If p = 1, then we are back in the usual univariate setting.
- $x_{ik}$  is the value of the k-th measurement on the i-th unit. For the i-th unit we have measurements

$$(x_{i1}, x_{i2}, \cdots, x_{ip})$$

#### **Organization of Data and Notation**

Descriptive Statistics

araphs and isualization

 We often display measurements from a sample of n units in matrix form:

$$X_{n \times p} = \begin{bmatrix} x_{11} & x_{12} & \cdots & x_{1p} \\ x_{21} & x_{22} & \cdots & x_{2p} \\ \vdots & \vdots & & \vdots \\ x_{n1} & x_{n2} & \cdots & x_{np} \end{bmatrix}$$

is a matrix with n rows (one for each unit) and p columns (one for each measured trait or variable).

### **Descriptive Statistics: Sample Mean & Variance**

Descriptive Statistics

Graphs and Visualization

• The sample mean of the kth variable  $(k = 1, \dots, p)$  is computed as

$$\bar{x}_k = \frac{1}{n} \sum_{i=1}^n x_{ik}$$

 The sample variance of the kth variable is usually computed as

$$s_k^2 = \frac{1}{n-1} \sum_{i=1}^n (x_{ik} - \bar{x}_k)^2$$

and the sample standard deviation is given by

$$s_k = \sqrt{s_k^2}$$

#### **Descriptive Statistics: Sample Covariance**

• We often use  $s_{kk}$  to denote the sample variance for the k-th variable. Thus,

$$s_k^2 = \frac{1}{n-1} \sum_{i=1}^n (x_{ik} - \bar{x}_k)^2 = s_{kk}$$

 The sample covariance between variable k and variable j is computed as

$$s_{jk} = \frac{1}{n-1} \sum_{i=1}^{n} (x_{ij} - \bar{x}_j)(x_{ik} - \bar{x}_k)$$

 If variables k and j are independent, the population covariance will be exactly zero, but the sample covariance will vary about zero

### **Sample Covariance**

#### Descriptive Statistics

# **Descriptive Statistics: Sample Correlation**

Descriptive Statistics

iraphs and isualization

 The sample correlation between variables k and j is defined as

$$r_{jk} = \frac{s_{jk}}{\sqrt{s_{jj}}\sqrt{s_{kk}}}$$

- ullet  $r_{jk}$  is between -1 and 1
- $r_{jk} = r_{kj}$

#### **Sample Correlation**

Descriptive Statistics

- The sample correlation is equal to the sample covariance if measurements are standardized (i.e.,  $s_{kk} = s_{jj} = 1$ )
- Covariance and correlation measure linear association. Other non-linear dependencies may exist among variables even if  $r_{jk}=0$
- The sample correlation  $(r_{ij})$  will vary about the value of the population correlation  $(\rho_{ij})$

#### **Matrix Representation of Sample Statistics**

CLEMS N

Sample statistics of a *p*-dimnesional multivariate data can be organized as vectors and matrices:

Graphs and

 $\bullet$   $\bar{x}$  =  $[\bar{x}_1, \bar{x}_2, \cdots, \bar{x}_p]^{\mathrm{T}}$  is the  $p \times 1$  vector of sample means

$$\bullet \ S = \begin{bmatrix} s_{11} & s_{12} & \cdots & s_{1p} \\ s_{21} & s_{22} & \cdots & s_{2p} \\ \vdots & \cdots & \cdots & \cdots \\ s_{p1} & s_{p2} & \cdots & s_{pp} \end{bmatrix} \text{ is the } p \times p \text{ symmetric matrix of }$$
 variance (on the diagonal) and covariances (the

variance (on the diagonal) and covariances (the off-diagonal elements)

$$\bullet \ \ \boldsymbol{R} = \begin{bmatrix} r_{11} & r_{12} & \cdots & r_{1p} \\ r_{21} & r_{22} & \cdots & r_{2p} \\ \vdots & \cdots & \cdots & \cdots \\ r_{p1} & r_{p2} & \cdots & r_{pp} \end{bmatrix} \text{is the } p \times p \text{ symmetric matrix of }$$
 sample correlations. Diagonal elements are all equal to 1

#### **Example: Bivariate Data**

Descriptive Statistics

Graphs and Visualization

• Data consist of n=5 receipts from a bookstore. On each receipt we observe the total amount of the sale (\$) and the number of books sold (p=2). Then

$$X_{5\times 2} = \begin{bmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \\ x_{31} & x_{32} \\ x_{41} & x_{42} \\ x_{51} & x_{52} \end{bmatrix} = \begin{bmatrix} 42 & 2 \\ 52 & 5 \\ 88 & 7 \\ 58 & 4 \\ 60 & 5 \end{bmatrix}$$

Sample mean vector is:

$$\bar{x} = \begin{bmatrix} \bar{x}_1 \\ \bar{x}_2 \end{bmatrix} = \begin{bmatrix} 60 \\ 5 \end{bmatrix}$$

#### **Example: Bivariate Data**

Descriptive Statistics

Araphs and /isualization

Sample covariance matrix is

$$S = \begin{bmatrix} s_{11} & s_{12} \\ s_{21} & s_{22} \end{bmatrix} = \begin{bmatrix} 294.0 & 19.0 \\ 19.0 & 1.5 \end{bmatrix}$$

Sample correlation matrix is

$$\mathbf{R} = \begin{bmatrix} r_{11} & r_{12} \\ r_{21} & r_{22} \end{bmatrix} = \begin{bmatrix} 1 & 0.90476 \\ 0.90476 & 1 \end{bmatrix}$$

#### **Generalized Variance**

- The generalized variance is a scalar value which generalizes variance for multivariate random variables
- ullet The generalized variance is defined as the determinant of the (sample) covariance matrix S,  $\det(S)$

#### Example:

```
'``{r}
data(mtcars)|
vars <- which(names(mtcars) %in% c("mpg", "disp", "hp", "drat", "wt"))
car <- mtcars[, vars]; S <- cov(car)
(genVar <- det(S))
'``</pre>
```

araphs and /isualization

#### **Graphs and Visualization**

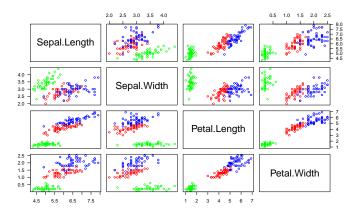

Descriptive Statistics

- Graphs convey information about associations between variables and also about unusual observations
- One difficulty with multivariate data is their visualization, in particular when p > 3.
- At the very least, we can construct pairwise scatter plots of variables

#### **Example: Fisher's Iris Data**

5 variables (sepal length and width, petal length and width, species (setosa, versicolor, and virginica), 50 flowers from each of 3 species  $\Rightarrow p = 4, n = 50 \times 3 = 150$ 

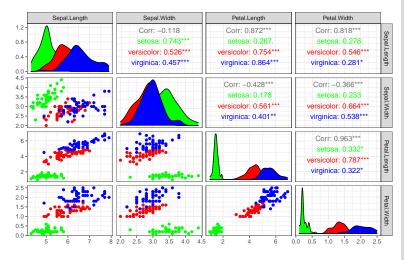

**Descriptive Statistics** 

#### Plotting Iris Data using ggpairs

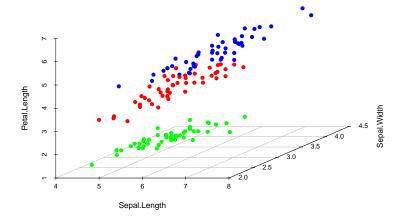

#### **3D Scatter Plot**

**Descriptive Statistics** 

#### **Chernoff Faces**
