Inferences for One Population Mean

Notes			

#### Inferences for One Population Mean $\mu$

**Goal**: To infer  $\mu = \mathbb{E}(X)$  from a random sample  $\{X_1,X_2,\cdots,X_n\}$ 

Point estimation:

$$\bar{X}_n = \frac{\sum_{i=1}^n X_i}{n}$$

- Interval Estimation:  $100 \times (1 \alpha)\%$  Confidence Interval (CI)
  - $\sigma = \sqrt{\operatorname{Var}(X)}$  is known:

$$\left(\bar{X}_n - z_{\alpha/2} \frac{\sigma}{\sqrt{n}}, \bar{X}_n + z_{\alpha/2} \frac{\sigma}{\sqrt{n}}\right)$$

•  $\sigma$  is unknown:

$$\left(\bar{X}_n - t_{\alpha/2,dt=n-1}\frac{s}{\sqrt{n}}, \bar{X}_n + t_{\alpha/2,dt=n-1}\frac{s}{\sqrt{n}}\right)$$

110100	
	-
	_

#### Margin of error & Sample Size Calculation

Margin of error:

$$z_{lpha/2} rac{\sigma}{\sqrt{n}}$$
 if  $\sigma$  known  $t_{lpha/2, df=n-1} rac{s}{\sqrt{n}}$  if  $\sigma$  unknown

- $\Rightarrow$  CI for  $\mu = ar{X}_{\it n} \pm$  margin of error
- Sample size determination:

$$n = \left(\frac{z_{\alpha/2} \times \sigma}{\text{margin of error}}\right)^2,$$

if  $\sigma$  is given

Notes	

Notes

#### Hypothesis Testing for $\mu$

State the null and alternative hypotheses:

$$H_0: \mu = \mu_0 \text{ vs. } H_a: \mu > \text{ or } \neq \text{ or } < \mu_0$$

Ompute the test statistic:

Make the decision of the test:

Rejection Region/ P-Value Methods

Oraw the conclusion of the test: We (do/do not) have enough statistical evidence to conclude that ( $H_a$  in words) at  $\alpha$ % significant level.

#### Type I, II Error & Power

True State	Decision			
True State	Reject H <sub>0</sub>	Fail to reject $H_0$		
H <sub>0</sub> is true	Type I error	Correct		
$H_0$ is false	Correct	Type II error		

- Type I error:  $\mathbb{P}(\text{Reject } H_0|H_0 \text{ is true}) = \alpha$
- Type II error:  $\mathbb{P}(\text{Fail to reject } H_0|H_0 \text{ is false}) = \beta$
- The power (PWR):  $\mathbb{P}(\text{Reject } H_0|H_0 \text{ is false}) = 1 \beta.$

$$\Rightarrow \mathsf{PWR}(\mu_{a}) = 1 - \beta(\mu_{a}) = 1 - \mathbb{P}(z^{*} \leq z_{\alpha} - \frac{|\mu_{0} - \mu_{a}|}{\sigma/\sqrt{n}})$$

(see the figure in page 5, Lecture 20)

Inferences for One Population Mean

Notes

#### **Duality of Hypothesis Test with Confidence Interval**

There is an interesting relationship between CIs and hypothesis tests. If  $H_0$  is rejected with significance level  $\alpha$  then the corresponding confidence interval does not contain the value  $\mu_0$  targeted in the hypotheses with the confidence level  $(1-\alpha)$ , and vice versa

Notes				

#### Statistical Inference for $\mu_1-\mu_2$

- Point estimation:  $\bar{X}_1 \bar{X}_2$
- Interval estimation:

$$\bar{X}_1 - \bar{X}_2 \pm \text{ margin of error},$$

where margin of error =

$$t_{\alpha/2,df^*}\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}, \quad df^* = \frac{\left(\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}\right)^2}{\frac{(s_1^2/n_1)^2}{n_1 - 1} + \frac{(s_2^2/n_2)^2}{n_2 - 1}}$$

When  $s_1$  and  $s_2$  "similar enoug", we replace  $\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}$  by  $s_p\sqrt{\frac{1}{n_1} + \frac{1}{n_2}}$ , where  $s_p = \sqrt{\frac{(n_1-1)s_1^2 + (n_2-1)s_2^2}{n_1 + n_2 - 2}}$

Notes			

#### Hypothesis Testing for $\mu_1 - \mu_2$

- State the null and alternative hypotheses:
  - Upper-tailed test:  $H_0: \mu_1 \mu_2 = 0$  vs.  $H_a: \mu_1 \mu_2 > 0$
  - Lower-tailed test:  $H_0: \mu_1 \mu_2 = 0$  vs.  $H_a: \mu_1 \mu_2 < 0$
  - Two-tailed test:  $H_0: \mu_1 \mu_2 = 0$  vs.  $H_a: \mu_1 \mu_2 \neq 0$
- Compute the test statistic:

$$t_{obs} = \begin{array}{c} \frac{\bar{X}_1 - \bar{X}_2}{\frac{\bar{X}_2 - \bar{X}_2}{n_1 + \frac{1}{n_2}}}, & \sigma_1 = \sigma_2 \\ \frac{\bar{X}_1 - \bar{X}_2}{\sqrt{\frac{s_1^2}{n_1} + \frac{s_2^2}{n_2}}}, & \sigma_1 \neq \sigma_2 \end{array}$$

• Make the decision of the test:

Rejection Region/ P-Value Methods

Draw the conclusion of the test

## Inferences for Matched Pairs

Notes			

#### **Paired T-Tests**

- When to use: before/after study, pairing subjects, study on twins, etc
- $H_0: \mu_{ extit{diff}} = 0$  vs.  $H_a: \mu_{ extit{diff}} > 0$  or  $\mu_{ extit{diff}} < 0$  or  $\mu_{ extit{diff}} \neq 0$ , where  $\mu_{\textit{diff}}$  is the population mean of the paired difference
- Test statistic:  $t_{obs} = \frac{\bar{X}_{diff} 0}{\frac{s_{diff}}{\sqrt{2}}}$

#### ANOVA and Overall F Test

#### **Overall F-Test**

- $H_0: \mu_1 = \mu_2 = \cdots = \mu_J$  $H_a$ : At least one mean is different
- ANOVA Table:

Source df SS MS F statistic Treatment J-1 SSTr MSTr  $=\frac{\text{SSTr}}{J-1}$   $F=\frac{\text{MSTr}}{\text{MSE}}$ N - J SSE MSE =  $\frac{SSE}{N-J}$ Error Total N-1 SSTo

• Test Statistic:  $F_{obs} = \frac{\text{MSTr}}{\text{MSE}}$ . Under  $H_0$ ,  $F^* \sim F_{df_1=J-1,df_2=N-J}$

## Family-Wise Error Rate (FWER) and Mulitple Comparisons

- Family-Wise Error Rate (FWER)  $\bar{\alpha}$ : the probability of making 1 or more type I errors in a set of hypothesis tests
- Bonferroni Correction: Adjust the significant level for each of the m tests to be  $\frac{\alpha}{m}$  to control the **FWER**
- Fisher's LSD and Tukey's HSD

#### **Linear Contrasts**

- **Definition**: Let  $c_1, c_2, \cdots, c_J$  are constants where  $\sum_{j=1}^J c_j = 0$ , then  $L = \sum_{j=1}^J c_j \mu_j$  is called a **linear contrast** of the population means.
- Point Estimation:

$$\hat{L} = \sum_{j=1}^{J} c_j \bar{X}_j$$

Interval Estimation:

$$(\hat{L} - t_{(\alpha/2,df=N-J)}\hat{se}_{\hat{L}}, \hat{L} + t_{(\alpha/2,df=N-J)}\hat{se}_{\hat{L}}),$$

where 
$$\hat{se}_{\hat{L}} = \sqrt{\mathsf{MSE}\left(\frac{c_1^2}{n_1} + \dots + \frac{c_J^2}{n_J}\right)}$$
