Examples of i.i.d. Noise

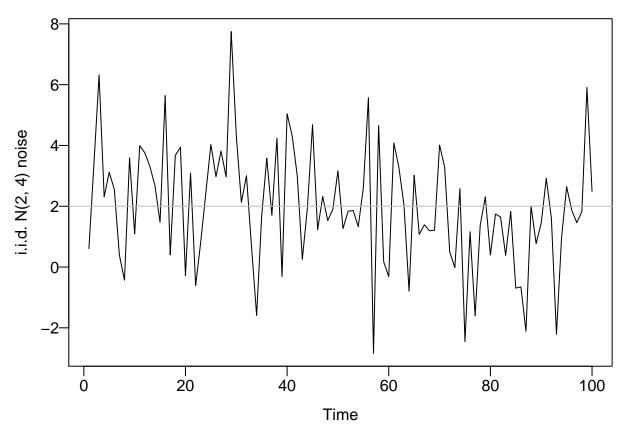

Examples realizations of white noise processes

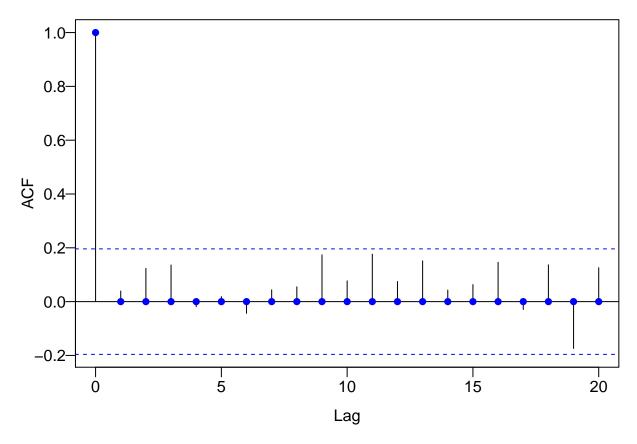

If Z_t is a white noise process, then its mean and variance are constants and uncorrelated in time Note: here we do not require the sequence follow the same distribution.

```
T = 100
t <- 1:T
WN1 <- rnorm(n = T, mean = 2, sd = 2)

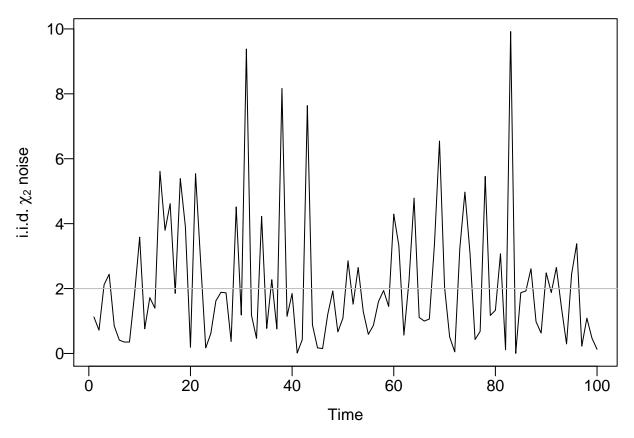

par(las = 1, mgp = c(2, 0.5, 0), mar = c(3.6, 3.6, 0.8, 0.6))
plot(t, WN1, type = "l", xlab = "Time", ylab = "i.i.d. N(2, 4) noise")
abline(h = 2, col = "gray")</pre>
```

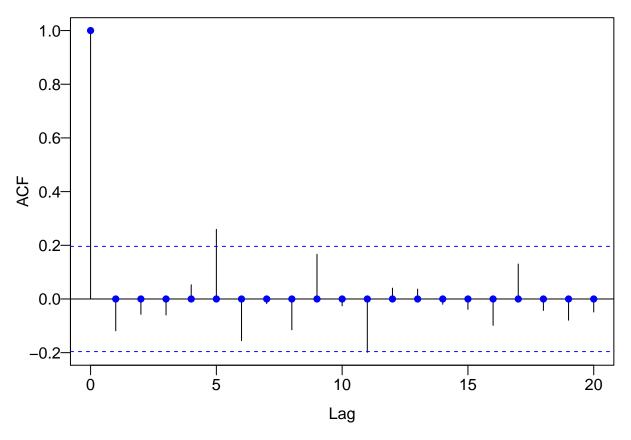

```
acf(WN1)
points(0:20, c(1, rep(0, 20)), pch = 16, col = "blue")
```

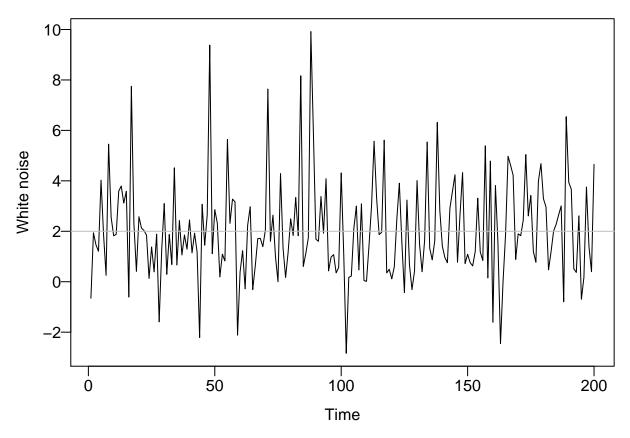

```
WN2 <- rchisq(n = T, df = 2)
plot(t, WN2, type = "l", xlab = "Time", ylab = expression(paste("i.i.d. ", chi[2], " noise")))
abline(h = 2, col = "gray")</pre>
```

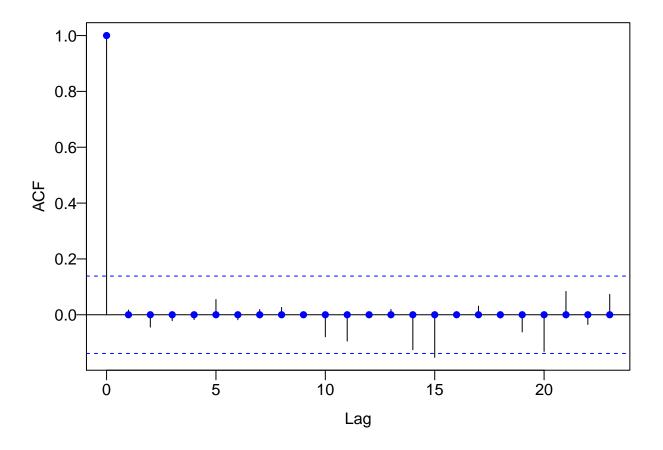

```
acf(WN2)
points(0:20, c(1, rep(0, 20)), pch = 16, col = "blue")
```

```
WN3 <- c(WN1, WN2)[sample(1:200)]
plot(1:200, WN3, type = "l", xlab = "Time", ylab = expression(paste("White noise")))
abline(h = 2, col = "gray")
```

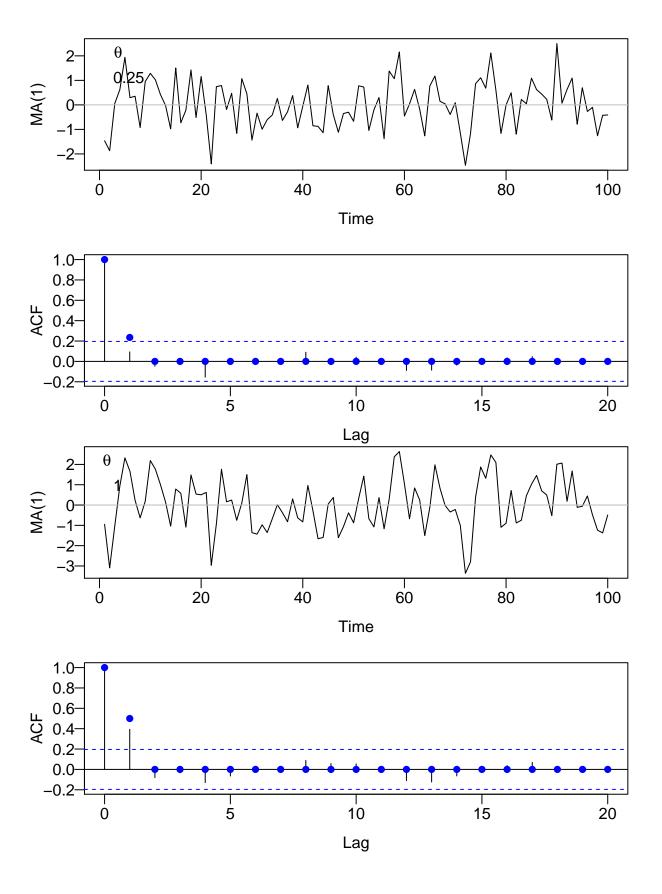

```
acf(WN3)
points(0:23, c(1, rep(0, 23)), pch = 16, col = "blue")
```

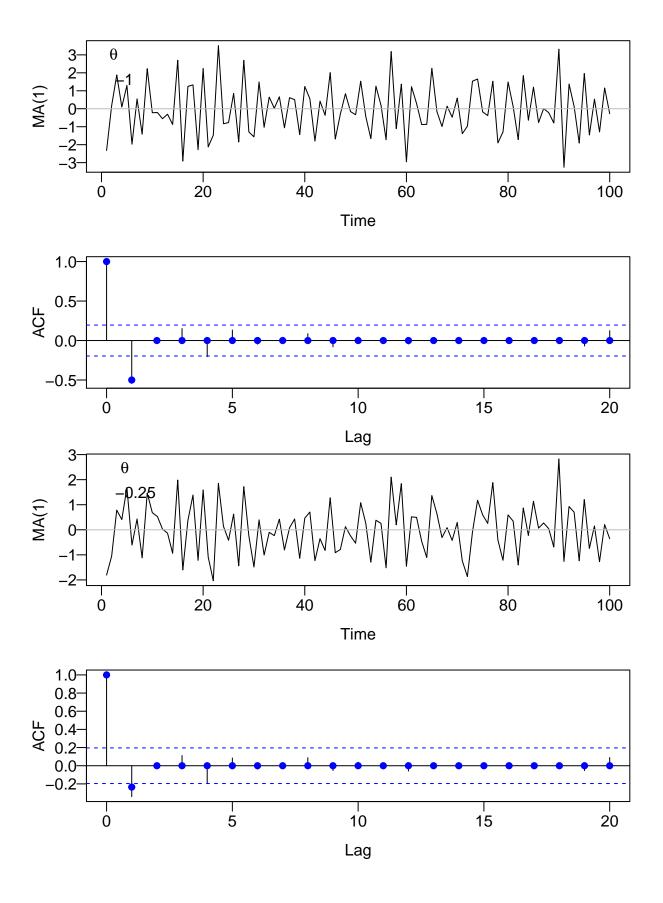

MA(1) processes

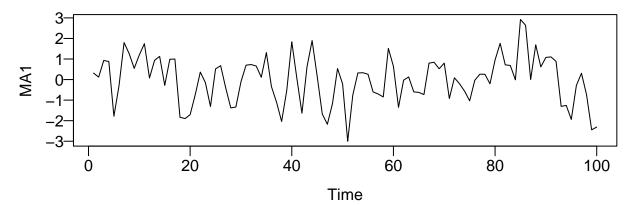

$$\eta_t = Z_t + \theta Z_{t-1},$$

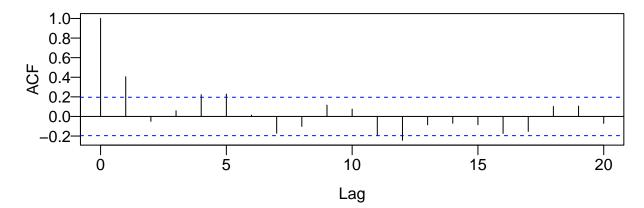

where $Z \sim WN(0, \sigma^2)$.

```
##another way to simulate MA(1)
MA1 <- arima.sim(n = 100, list(ma = c(0.5)))
plot(MA1)
acf(MA1)</pre>
```

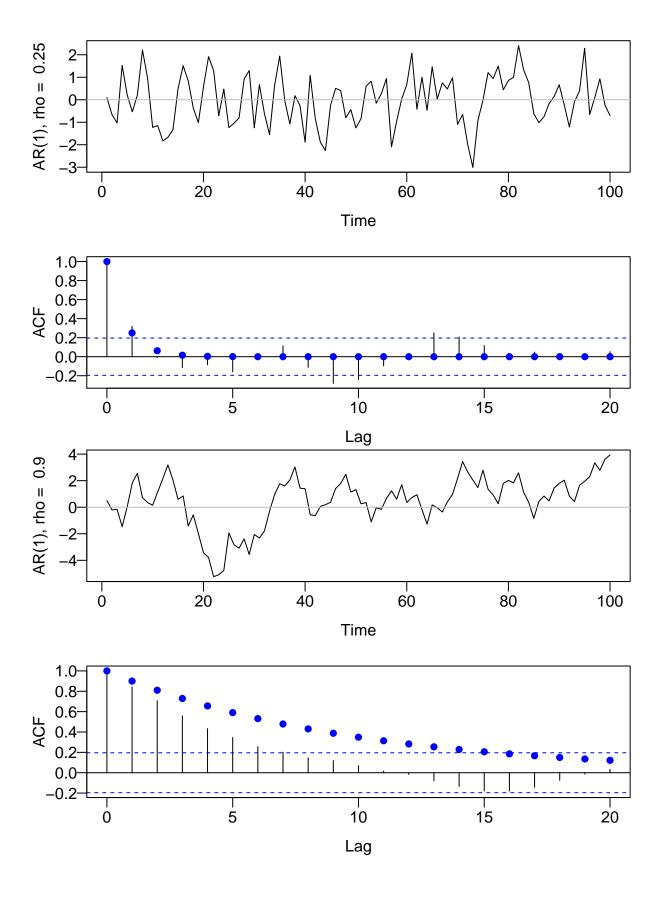

AR(1) processes

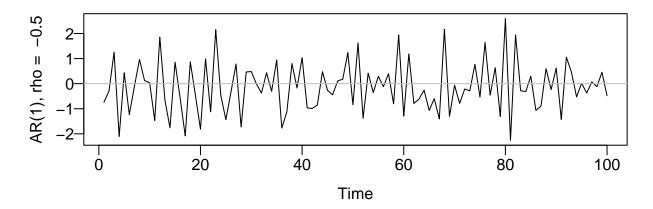

$$\eta_t = \phi \eta_{t-1} + Z_t,$$

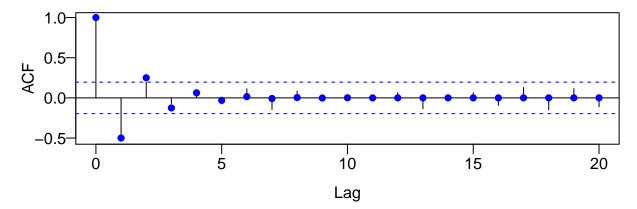

where $|\rho| < 1$ is a constant and η_s and Z_t are uncorrelated for all $s < t \Rightarrow$ future noise is uncorrelated with the current value.

```
phi <- c(0.25, 0.9, -0.5)

par(las = 1, mgp = c(2, 0.5, 0), mar = c(3.6, 3.6, 0.8, 0.6), mfrow = c(2, 1))
for (i in 1:3){
    AR1 <- arima.sim(n = 100, list(ar = c(phi[i])))
    plot(t, AR1, type = "l", xlab = "Time",
        ylab = paste("AR(1), rho = ", phi[i]))
    abline(h = 0, col = "gray")
    acf(AR1)
    points(0:20, phi[i]^(0:20), pch = 16, col = "blue")
}</pre>
```

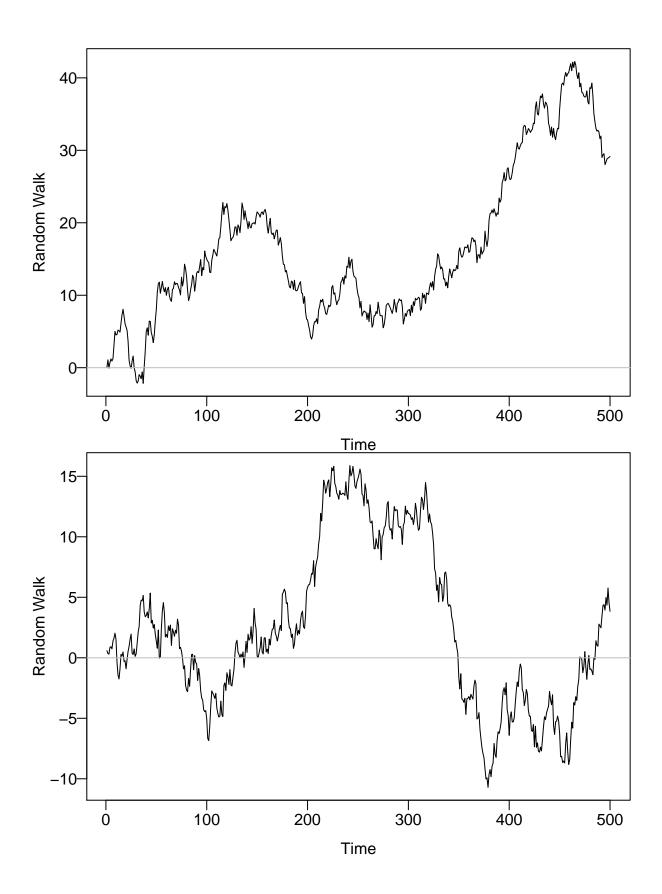

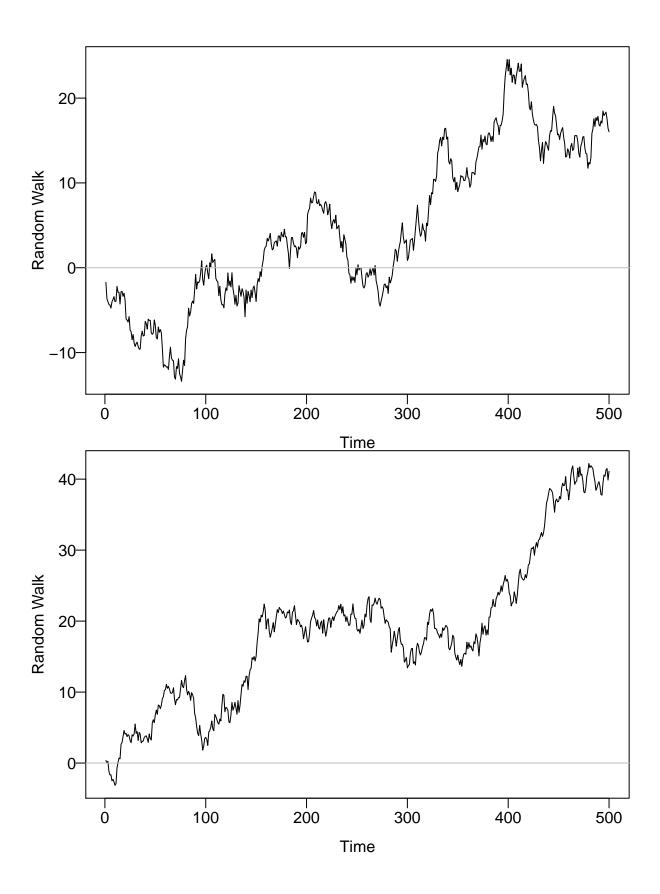

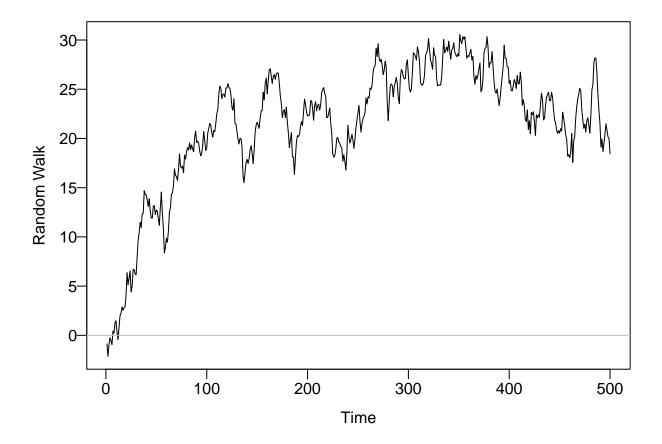

Random walk

$$\eta_t = \sum_{s=1}^t Z_s.$$

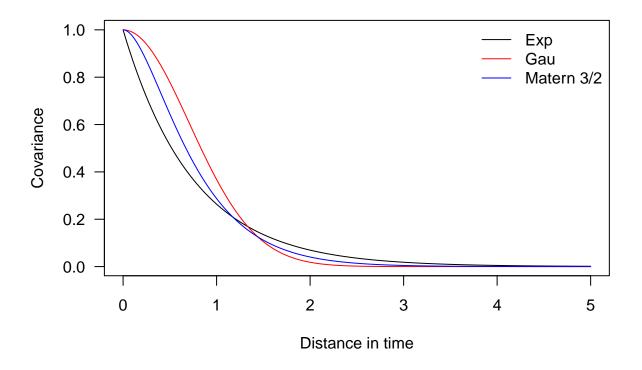

Gaussian process

Different covaraince functions (kernels)

Generate one sample from each Gaussian Process with different kernels
