Check	1
Constructing pointwise CIs/PIs	1
Hypothesis Tests for β_1	2

The main purpose of this lab is to review how to use R to conduct a simple linear regression analysis

Example: Maximum Heart Rate vs. Age

The maximum heart rate (HR_{max}) of a person is often said to be related to age (Age) by the equation:

$$HR_{max} = 220 - Age$$

Let's use a dataset to assess this statement.

Load the dataset

There are several ways to load a dataset into R, for example, one could importing the data over the Internet

```
dat <- read.csv('http://whitneyhuang83.github.io/STAT8010/Data/maxHeartRate.csv', header = T)</pre>
head(dat)
     Age MaxHeartRate
##
## 1 18
                  202
## 2
     23
                   186
      25
                  187
## 3
## 4
     35
                   180
     65
                  156
## 5
## 6
     54
                   169
```

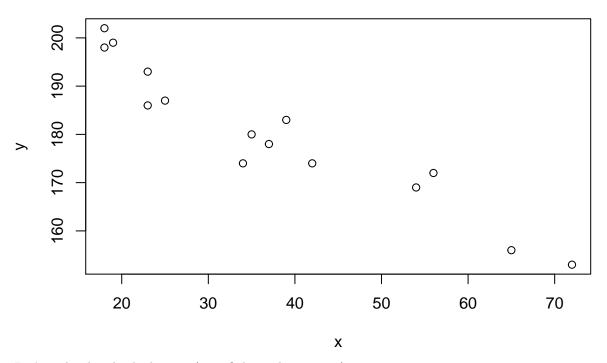

Examine the data before fitting models

```
y <- dat$MaxHeartRate; x <- dat$Age
summary(dat)
##

## [1] 305.8095
## [1] 214.0667
cov(x, y)
## [1] -243.9524
cor(x, y)
## [1] -0.9534656
```

Plot the data before fitting models

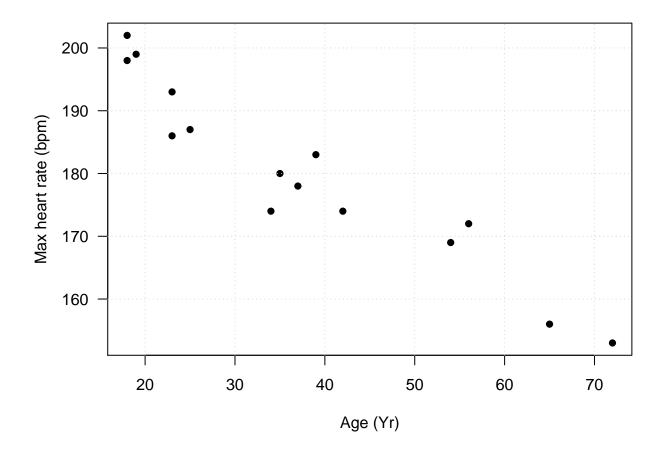

This is what the scatterplot would look like by default. Put predictor (age) to the first argument and response (maxHeartRate) to the second argument.

plot(x, y)

Let's make the plot look nicer (type ?plot to learn more).

```
par(las = 1, mar = c(4.1, 4.1, 1.1, 1.1))
plot(x, y, pch = 16, xlab = "Age (Yr)", ylab = "Max heart rate (bpm)")
grid()
```

Simple linear regression

Estimation

Let's do the calculations to figure out the regression coefficients as well as the standard deviation of the random error.

Slope:
$$\hat{\beta}_1 = \frac{\sum_{i=1}^n (y_i - \bar{y})(x_i - \bar{x})}{\sum_{i=1}^n (x_i - \bar{x})^2}$$

```
y_diff <- y - mean(y)
x_diff <- x - mean(x)
beta_1 <- sum(y_diff * x_diff) / sum((x_diff)^2)
beta_1</pre>
```

[1] -0.7977266

Intercept: $\hat{\beta}_0 = \bar{y} - \bar{x}\hat{\beta}_1$

[1] 210.0485

Fitted values: $\hat{y} = \hat{\beta}_0 + \hat{\beta}_1 x$

```
y_hat <- beta_0 + beta_1 * x
y_hat</pre>
```

[1] 195.6894 191.7007 190.1053 182.1280 158.1962 166.9712 182.9258 165.3758

[9] 152.6121 194.8917 191.7007 176.5439 195.6894 178.9371 180.5326

$$\hat{\sigma}$$
: $\hat{\sigma}^2 = \frac{\sum_{i=1}^{n} (y_i - \hat{y}_i)^2}{n-2}$

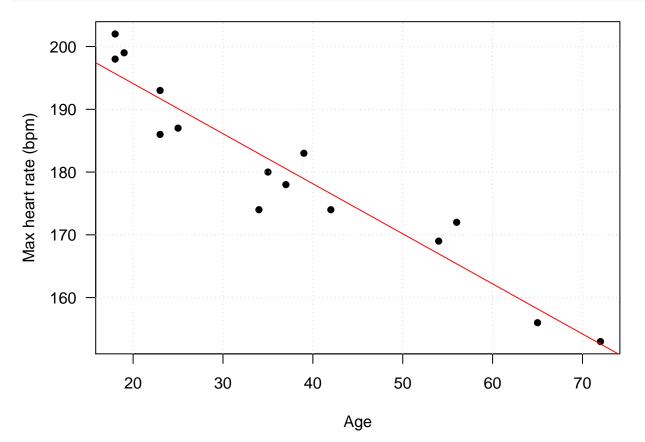

```
sigma2 \leftarrow sum((y - y_hat)^2) / (length(y) - 2)

sqrt(sigma2)
```

[1] 4.577799

Add the fitted regression line to the scatterplot

```
par(las = 1, mar = c(4.1, 4.1, 1.1, 1.1))
plot(x, y, pch = 16, xlab = "Age", ylab = "Max heart rate (bpm)")
grid()
abline(a = beta_0, b = beta_1, col = "red")
```

Let R do all the work

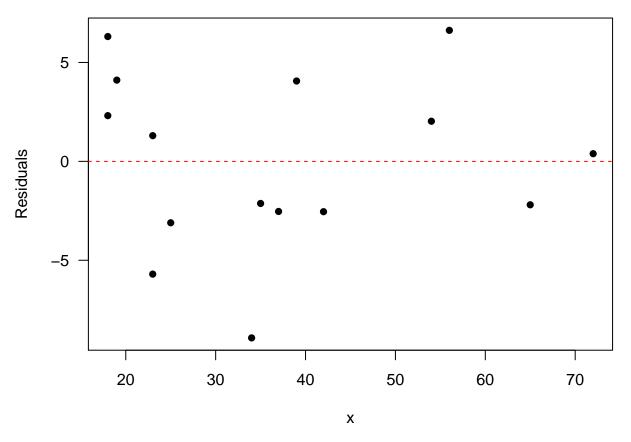

```
fit <- lm(MaxHeartRate ~ Age, data = dat)</pre>
summary(fit)
##
## Call:
## lm(formula = MaxHeartRate ~ Age, data = dat)
