Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Let X be a random variable with pmf defined as follows:

$$p_X(x) = \begin{cases} k(5-x) & \text{if} \quad x = 0, 1, 2, 3, 4 \\ 0 & \text{otherwise} \end{cases}$$

1. Find the value of k that makes $p_X(x)$ a legitimate pmf.

2. What is the probability that X is between 1 and 3 inclusive?

3. If X is not 0, what is the probability that X is less than 3?

Example Cont'd

Probability IV

CLEMSON
UNIVERSITY

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

1 Want to find k s.t.

$$\sum_{x=0}^{4} p_X(x) = \sum_{x=0}^{4} k(5-x) = 1$$

$$\Rightarrow 15k = 1 \Rightarrow k = \frac{1}{15}$$

2

$$P(1 \leq X \leq 3) = P(X=1) + P(X=2) + P(x=3)$$

$$= \frac{4}{15} + \frac{3}{15} + \frac{2}{15} = \frac{9}{15} = 0.6$$

3

$$P(X < 3 | x \neq 0) = \frac{P(X < 3 \& X \neq 0)}{P(X \neq 0)}$$

$$= \frac{P(0 < X < 3)}{1 - P(X=0)} = \frac{4/15 + 3/15}{1 - 5/15} = 0.7$$

Mean of Discrete Random Variables

The mean of a discrete r.v. X, denoted by $\mathrm{E}[X]$, is defined by

$$\mathrm{E}[X] = \sum_x x \times p_X(x)$$

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Remark:

The mean of a discrete r.v. is a weighted average of its possible values, and the weight used is its probability. Sometimes we refer to the expected value as the expectation (expected value), or the first moment.

For any function, say $g(X)$, we can also find an expectation of that function. It is

$$\mathrm{E}[g(X)] = \sum_x g(x) \times p_X(x)$$

Example

$$\mathrm{E}[X^2] = \sum_x x^2 \times p_X(x)$$

Properties of Mean

Let X and Y be discrete r.v.s defined on the same sample space and having finite expectation (i.e. $\mathbb{E}[X], \mathbb{E}[Y] < \infty$). Let a and b be constants. Then the following hold:

- $\mathrm{E}[X + Y] = \mathrm{E}[X] + \mathrm{E}[Y]$

- $\mathrm{E}[aX + b] = a \times \mathrm{E}[X] + b$

Number of Siblings Example Revisited

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Siblings (X)	Frequency	Relative Frequency
0	8	.200
1	17	.425
2	11	.275
3	3	.075
4	1	.025
Total	40	1

Find the expected value of the number of siblings

Solution.

Probability IV

CLEMSON
UNIVERSITY

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Siblings (X)	Frequency	Relative Frequency
0	8	.200
1	17	.425
2	11	.275
3	3	.075
4	1	.025
Total	40	1

Find the expected value of the number of siblings

Solution.

$\mathbb{E}[X] = \sum_x x p_X(x) = 0 \times .200 + 1 \times .425 + 2 \times .275 + 3 \times .075 + 4 \times .025 = 1.3$

Variance/Standard Deviation of Discrete r.v.'s

The **variance** of a (discrete) r.v., denoted by $\mathrm{Var}(X)$, is a measure of the spread, or variability, in the r.v. $\mathrm{Var}(X)$ is defined by

$$\mathrm{Var}(X) = \mathrm{E}\left[(X - \mathrm{E}[x])^2\right]$$

or

$$\mathrm{Var}(X) = \mathrm{E}[X^2] - (\mathrm{E}[X])^2$$

The **standard deviation**, denoted by $sd(X)$, is the square root of its variance

Properties of Variance

Probability IV

CLEMSON
U N I V E R S I T Y

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Let c be a constant. Then the following hold:

- $\text{Var}(cX) = c^2 \times \text{Var}(X)$

- $\text{Var}(X + c) = \text{Var}(X)$

Suppose X and Y are random variables with $E[X] = 3$, $E[Y] = 4$ and $\text{Var}(X) = 4$. Find:

1. $E[2X + 1]$

Suppose X and Y are random variables with $E[X] = 3$, $E[Y] = 4$ and $Var(X) = 4$. Find:

1. $E[2X + 1]$

2. $E[X - Y]$

Example

Hypergeometric
Random Variable

Continuous Random
Variables

Suppose X and Y are random variables with $\mathrm{E}[X] = 3$, $\mathrm{E}[Y] = 4$ and $\mathrm{Var}(X) = 4$. Find:

1. $\mathrm{E}[2X + 1]$

2. $\mathrm{E}[X - Y]$

3. $\mathrm{E}[X^2]$

4. $\mathrm{E}[X^2 - 4]$

5. $\mathrm{E}[(X - 4)^2]$

Suppose X and Y are random variables with $E[X] = 3$, $E[Y] = 4$ and $Var(X) = 4$. Find:

1. $E[2X + 1]$

2. $E[X - Y]$

3. $E[X^2]$

4. $E[X^2 - 4]$

5. $E[(X - 4)^2]$

6. $Var(2X - 4)$

Binomial Random Variable

We define the Binomial r.v. as the number of successes in n Bernoulli trials, where the probability of success in one trial is p. Let X be a Binomial r.v.

- The definition of X: # of successes in n trials of Bernoulli trials.

Binomial Random Variable

We define the Binomial r.v. as the number of successes in n Bernoulli trials, where the probability of success in one trial is p. Let X be a Binomial r.v.

- The definition of X: # of successes in n trials of Bernoulli trials.
- The support: $0, 1, \cdots, n$

Binomial Random Variable

We define the Binomial r.v. as the number of successes in n Bernoulli trials, where the probability of success in one trial is p. Let X be a Binomial r.v.

- The definition of X: # of successes in n trials of Bernoulli trials.
- The support: $0, 1, \cdots, n$
- Its parameter(s) and definition(s): p: the probability of success on 1 trial; n is the sample size

Binomial Random Variable

We define the Binomial r.v. as the number of successes in n Bernoulli trials, where the probability of success in one trial is p. Let X be a Binomial r.v.

- The definition of X: # of successes in n trials of Bernoulli trials.
- The support: $0, 1, \cdots, n$
- Its parameter(s) and definition(s): p: the probability of success on 1 trial; n is the sample size
- The probability mass function (pmf):

$$p_X(x) = \binom{n}{x} p^x (1-p)^{n-x}, \ x = 0, 1, \cdots, n$$

To test for Extrasensory perception (ESP), we have 4 cards. They will be shuffled and one randomly selected each time, and you are to guess which card is selected. This is repeated 10 times. Suppose you do not have ESP. Let R be the number of times you guess a card correctly. What are the distribution and parameter(s) of R? What is the expected value of R? Furthermore, suppose that you get certified as having ESP if you score at least an 8 on the test. What is the probability that you get certified as having ESP?

Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Suppose that 95% of consumers can recognize Coke in a blind taste test. Assume consumers are independent of one another. The company randomly selects 4 consumers for a taste test. Let X be the number of consumers who recognize Coke.

1. What is the probability that X is at least 1?

2. What is the probability that X is at most 3?

Binomial and Hypergeometric r.v.s

The binomial distribution describes the probability of k successes in n trials with replacement.

We want a distribution to describe the probability of k successes in n trials without replacement from a finite population of size N containing exactly K successes.
$\Rightarrow$ Hypergeometric Distribution

Important applications are **quality control** and statistical **estimation of population proportions**. The hypergeometric r.v. is the equivalent of a Binomial r.v. except that sampling is done without replacement.

An Example of Hypergeometric r.v.

Probability:
What is the probability to get 1 red and 2 black balls?

Statistics:
What percentage of balls in the box are red?

Hypergeometric r.v.s

Probability IV

CLEMSON
UNIVERSITY

Binomial Random
Variables

Hypergeometric
Random Variable

Continuous Random
Variables

Let X be a hypergeometric r.v.

- The definition of X: # of successes in n trials of a random experiment, where sampling is done without replacement (or trials are dependent)
- The support: $k \in \{\max(0, n + K - N), \cdots, \min(n, K)\}$
- Its parameter(s) and definition(s): N: the population size, n: the sample size, and K: number of success in the population
- The probability mass function (pmf): $p_X(k) = \frac{\binom{K}{k} \times \binom{N-K}{n-k}}{\binom{N}{n}}$
- The expected value: $\mathrm{E}[X] = n\frac{K}{N}$
- The variance: $\mathrm{Var}(X) = n\frac{K}{N}\frac{N-K}{N}\frac{N-n}{N-1}$

There are 100 identical looking 52" TVs at Best Buy in Anderson, SC. Let 10 of them be defective. Suppose we want to buy 8 of the aforementioned TVs (at random). What is the probability that we don't get any defective TVs?

Solution.

Example

There are 100 identical looking 52" TVs at Best Buy in Anderson, SC. Let 10 of them be defective. Suppose we want to buy 8 of the aforementioned TVs (at random). What is the probability that we don't get any defective TVs?

Solution.

Let D be the number of defective TVs in the sample.

$D \sim Hyp(N = 100, n = 8, K = 10)$

$\mathrm{P}(D = 0) = \frac{\binom{10}{0}\binom{90}{8}}{\binom{100}{8}} = 0.4166$

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \leq p_X(x) \leq 1$ for all possible values of x
- $\sum_x p_X(x) = 1$

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \le p_X(x) \le 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \le X \le b) = \sum_{x=a}^{x=b} p_X(x)$

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \le p_X(x) \le 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \le X \le b) = \sum_{x=a}^{x=b} p_X(x)$

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \le p_X(x) \le 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \le X \le b) = \sum_{x=a}^{x=b} p_X(x)$

For continuous distributions, the properties for probability density functions (Pdfs) are similar:

- $f_X(x) \ge 0$ for all possible values of x

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \leq p_X(x) \leq 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \leq X \leq b) = \sum_{x=a}^{x=b} p_X(x)$

For continuous distributions, the properties for probability density functions (Pdfs) are similar:

- $f_X(x) \geq 0$ for all possible values of x
- $\int_{-\infty}^{\infty} f_X(x)\, dx = 1$

Probability Mass Functions v.s. Probability Density Functions cont'd

Recall the properties of discrete probability mass functions (Pmfs):

- $0 \le p_X(x) \le 1$ for all possible values of x
- $\sum_x p_X(x) = 1$
- $\mathbb{P}(a \le X \le b) = \sum_{x=a}^{x=b} p_X(x)$

For continuous distributions, the properties for probability density functions (Pdfs) are similar:

- $f_X(x) \ge 0$ for all possible values of x
- $\int_{-\infty}^{\infty} f_X(x)\, dx = 1$
- $\mathbb{P}(a \le X \le b) = \int_a^b f_X(x)\, dx$

Example

Let X represent the diameter in inches of a circular disk cut by a machine. Let $f_X(x) = c(4x - x^2)$ for $1 \le x \le 4$ and be 0 otherwise. Answer the following questions:

1. Find the value of c that makes this a valid pdf

2. Find the expected value and variance of X

3. What is the probability that X is within $.5$ inches of the expected diameter?

4. Find $F_X(x)$
